

Novel Coronavirus (COVID-19) and ProSpray™ Disinfectants What You Need To Know

An update from Certol International.

For Immediate Release • September 25, 2020

Certol's family of disinfectants are approved by the EPA for inclusion in List N: Disinfectants for use against SARS-CoV-2 (COVID-19).

This includes liquid ProSpray™ Ready-to-Use EPA Registration # 46851-5, liquid concentrates ProSpray C-60™, OMNI II™, Vital Defense® -D with EPA Registration # 46851-1 and ProSpray™ wipes (all sizes) with EPA Registration # 46851-12.

Certol liquids and wipes are EPA registered intermediate-level hospital grade disinfectants. The intermediate-level rating is based on proven action to inactivate harder to kill pathogens like the very resistant mycobacterium tuberculosis (TB). This rating along with tested label claims to inactivate herpes and HIV assures users that Certol disinfectants are effective against COVID-19.

While there are numerous disinfecting products on the market, our suggestion is to choose carefully. Many products are toxic if used in large quantities and many are harmful to surfaces and equipment. Certol disinfectants are water based with dual action to clean and kill, removing mucous and other soils while inactivating dangerous pathogens hiding within. Certol disinfectants clean and kill without solvents or high alcohol content that may damage plastics or other materials.

Certol International is actively pursuing lab testing for additional kill claims and will issue updates when available.
